## CULTURAL & SOCIAL ACTIVITIES

Being a student, you too can make a difference by taking baby steps. Your participation in solving social problems has the power to promote the personal and collective identity. You may be aware of different measures and ways to help, but the question is, do you implement them?

Student social responsibility mainly focuses on taking responsibility for one's own actions. It is a promise everyone should make for the society while working for the social, cultural and, ecological causes. These responsibilities are ethically binding and propose that each person acts in such a way that minimizes the adverse effect to those immediately around them.

So GGSP students implemented 'My College My Ownership' program to increase awareness about social responsibility and ownership feeling among students.

## TECH TALK- FROM THE DESK OF FACULTY

### BLOCKCHAIN TECHNOLOGY

Blockchain Technology is a digital ledger that records transactions across a peer-to-peer network. The Blockchain database is distributed across multiple computers and stored in 'blocks', which are linked together to create the chain. Each block contains information about the previous block, as well as information about the transaction being made at that time. This means that all parties involved in a transaction can see it on the Blockchain ledger without having to trust any third party. The Blockchain was first conceptualized by an anonymous programmer or group of programmers under the pseudonym 'Satoshi Nakamoto' in 2008 for use in digital currency Bitcoin. Since then, many other applications have been built on top of this core concept such as Ethereum, Hyperledger, and Ripple. Blockchain has several key benefits over traditional systems: transparency, security, reliability and scalability. These properties make it ideal for use cases such as banking or supply chain management where trust between parties is paramount but speed and cost constraints exist within legacy systems.

However, despite its potential there are still some limitations with Blockchain technology which need to be addressed before widespread adoption can occur. End of the day, Blockchain has a lot of potential and is not just about bit coin. It can be used for many other things as well.

## TECH TALK- STUDENT CORNER

### METaverse

Technically, a metaverse is a collective virtual shared space, created by the convergence of virtually enhanced physical and digital reality. For simplicity's sake, think of a metaverse as the next iteration of the internet, which started as individual bulletin boards and independent online destinations. Eventually these destinations became sites on a virtual shared space – similar to how a metaverse will develop. A metaverse is not device-independent, nor owned by a single vendor. It is an independent virtual economy, enabled by digital currencies and non-fungible tokens (NFTs). As a combinatorial innovation, metaverses require multiple technologies and trends to function. Contributing trends include virtual reality (VR), augmented reality (AR), flexible work styles, head-mounted displays (HMDs), an AR cloud, the Internet of Things (IoT), 5G, artificial intelligence (AI) and spatial computing.

"Metaverse" became a household word when Facebook rebranded its corporate identity to Meta in October 2021 and announced plans to invest at least 10 billion in the concept that year. In addition to Meta, tech giants including Google, Microsoft, Nvidia and Qualcomm are also investing billions of dollars in the concept. Opportunities are emerging fast, but organizations should be careful when investing in a specific metaverse, as it is too early to determine which are viable for the long term.
